Developing a prototype decision support framework to assess forest management scenarios as a nature-based decarbonization solution for the mining sector: A case study in British Columbia, Canada

Open Data Input

We use publicly available input data, and fully reproducible data processing and modelling open pipeline.

Open Code DSS

Prototype DSS framework to assess decarbonization opportunities from forest management near mining sites.

Scenarios and Tradeoffs

Interactive exploration of tradeoffs between economic, environmental, and social indicators across scenarios.

Mining Sector Decarbonization

Explore emissions reduction potential from new mining sector investments in nature-based decarbonization projects targeting local forest ecosystems and forest-dependent communities around mine sites.
